## TECHNICAL CHARACTERISTICS

The housing shape has been optimized to maximize the draining of water or liquid in the event of the gearbox being subjected to splashing or washing.

From BOX 75 and up, 2 taper roller bearings are mounted on the wormshaft improving the mechanical resistance to the axial thrust generated by the wormwheel.

The combination of taper roller bearings and 2 nilos (mounted on the BOX sizes 75 to 150) retains the grease in the bearings even when they are not in contact with the gearbox lubricant and also permits the mounting of the whole BOX range from the size 25 to the size 150 in the positions V5 and V6 without any additional accessories.

The new patented "BOX" series of worm gear units is made with die cast aluminium housing from size 25 up to 90 and is cast iron for the size 110, 130 & 150.

The housing has been designed using parametric 3D CAD software supported by systematic analysis of the thermal dissipation capacity and the structural resistance to deformation under the effect of working loads.

Mounting positions B6 or B7 are also permitted on all the BOX series, thanks to the adoption of 2RS auto-lubricated bearings on the output gear. In conclusion, the whole BOX series can be mounted in any position with no need of specifications in the order.

## TECHNICAL CHARACTERISTICS

PATENTED

BOX units sizes 25 up to 90 are supplied with long life synthetic oil and they do not require any maintenance during their lifetime. BOX size 110-150 uses mineral oil, but synthetic oil is available on request.

Each gearbox is supplied with a full set of filler, level and breather plugs, permitting all mounting positions.

In order to reduce noise, improve efficiency and durability, the wormshaft is made of case hardened steel and profile ground, while the worm wheel is in shell cast ZCuSn12 bronze.

Before being assembled, the worm wheel is subjected to 'running in' to improve its surface finish and reduce noise.

A coat of paint seals minor surface porosities in aluminium and also protects the housing from oxidation.

Mating surface are machined for perfect perpendicularity.

2 safety plastic covers on the output are always provided to protect BOX during transportation and storage, and then the user from accidental contacts with moving parts.

## EFFICIENCY

An inherent factor in the selection of worm gear boxes is the efficiency  $\eta$ , defined as the ratio of mechanical power available at the output shaft and the power applied at the input shaft:

$$\eta = \frac{P_{n2}}{P_{n1}}$$

In practice, efficiency depends on:

- helix angle
- materials of matching parts
- tooth form accuracy
- gear finishing
- lubrication
- gear sliding speed
- friction of seals and bearings
- load vibrations
- temperature

In the combined BOX units (BOX+BOX) the total efficiency value is the product of the efficiency of the two single gear boxes composing the combined unit.

### Dynamic efficiency $\eta_d$

It is the efficiency value achieved after completion of the running in time of few hours. This efficiency remains almost constant during the operating life of the gearbox.

The graph 1 shows the time required to reach the maximum value of dynamic efficiency

### Static efficiency $\eta_s$

It is the efficiency obtained at start-up and is particularly important in the choice of a BOX unit on intermittent duty applications (like lifts, hoists) where due to very short operating time, the standard operating conditions are seldom reached. In such applications, the motor rating is to be suitably increased to compensate for the poor efficiency of the BOX unit while starting up ( $\eta_s < \eta_d$ ).

## IRREVERSIBILITY

Some BOX units permit the locking and holding in place the load and prevent reverse motion even when electric power is switched off.

This feature called irreversibility is inversely proportional to the efficiency and the helix angle and directly proportional to the reduction ratio.

The profile of gear teeth and the helix angle of gears has the most significant bearing on the overall efficiency of the gearbox.

In order to achieve the optimum solution for any application it is necessary to analyze the difference between static and dynamic irreversibility.

### Static irreversibility:

A BOX unit has a low static reversibility when it is possible to rotate it only by driving the output shaft with a very high torque and / or vibration or twisting of the output load. The static irreversibility is inversely proportional to the static efficiency. Theoretically:

$\eta_s < 50\%$	static irreversibility
$50\% < \eta_s < 55\%$	low static reversibility
$\eta_s \geq 55\%$	good static reversibility

### Dynamic irreversibility:

This is the most difficult condition to achieve. It occurs when the output shaft stops rotating as soon as the input shaft stops rotating. The dynamic irreversibility is inversely proportional to the dynamic efficiency. Theoretically:

$\eta_s < 40\%$	total dynamic irreversibility
$40\% < \eta_s < 50\%$	good dynamic irreversibility
$50\% < \eta_s < 60\%$	low dynamic reversibility
$\eta_s \geq 60\%$	good dynamic reversibility

**The table 1 states an indicative condition of the different degrees of irreversibility based on the helix angle.**

(Note: Whenever a total irreversibility of a BOX unit is important for safety reasons, we strongly recommend the use of brake motors of the series Delphi ATAC or ATDC.)

Maintenance	pre-lubricated by Rotomotive							Supplied mineral oil. Can be supplied Synthetic oil at an extra cost		
	none, lifetime lubrication							oil change after 400 working hours, then every 4000 working hours		

Unless otherwise specified, wormgear BOX sizes 25 to 90 are supplied with long life synthetic lubrication and they do not require any maintenance. However, if any topping up is required, it can be done using the filler hole provided on the gearboxes.

BOX110, BOX130 and BOX150 however must be filled with oil prior to be operated.

The use of oil instead of grease drastically improves the lubrication effectiveness and efficiency, particularly in the "limit layer" condition as well as in highly intermittent applications.

Furthermore synthetic oil lubrication assures a much wider range of low and high operating temperatures.

With the use of synthetic oil the limits of temperature rise during operation are determined by the properties of the seal material as well as the thermal expansion of the gearbox case (tab 3)

**All units are supplied with plugs for filling, discharging and checking the level of the oil. Furthermore, a breather plug is also supplied with BOX63, BOX75, BOX90, BOX110, BOX130 and BOX150.**

Before start-up it is essential to replace the blind plug on the upper side of the unit with the breather plug. This operation is mandatory on BOX110, 130 and 150.

It is however advisable that solid plugs be used in ratios up to 40 as there may be some seepage of oil from the breather plug at certain speeds due to churning action of the gears.

## MOUNTING POSITIONS

The combination of the input shaft of 2 taper roller bearings (mounted on the BOX size 75 and up to achieve high resistance to the axial loads) and 2 nilos (mounted on the BOX sizes 75 up to 150 to keep lubricating grease inside the bearings even when they are not in contact with the lubricant inside the gear case), **permits the mounting of the whole BOX range from the size 25 to the size 150, in the positions V5 and V6.**

The mounting positions B6 or B7 of the units BOX063, BOX075, BOX090, BOX130 or BOX150 must be mentioned in the order:

tab. 2

load classification	application
<b>c</b> Uneven operation, heavy loads, larger mass to be accelerated	Conveyors with violent jerks, compressors and alternating pumps with one or more cylinders, machinery for bricks, tiles and clay, kneaders, milling machines, lifting machines, lifting winches with buckets, rotary furnaces, heavy fans or mining purposes, mixers for heavy materials, machine tools, planning machines, alternating saws, shears, tumbling barrels, vibrators, shredders
<b>b</b> Starting with moderate loads uneven operating conditions, medium size mass to be accelerated	Belt conveyers with varied load with transfer for bridge trucks of light duty, leveling machines, shakers and mixers for liquid with variable density and viscosity machines for the food industry (kneading through, mincing machines, slicing machines, etc) sifting machines for sand gravel, textile industry machines, cranes, hoists, goods lifts, fertilizer scrapers, concrete mixers, folding machines, winches, crane mechanisms
<b>a</b> Easy starting, smooth operation, small mass to be accelerated	Belt conveyers for light material, centrifugal pump, rotary gear pump, screw feeders for light materials, lifts, bottling machines, controls of machine tools, fans, power generators, filters, small mixers.

If, after the selection of the right  $M_{r2}$  and  $n_2$  in the following performance tables, a BOX unit whose service factor  $f_s$  is = of the requested one  $f_{sr}$ , is not found, then it is advisable to choose a BOX unit in which  $M_{n2} > M_{r2}$ . In order to satisfy  $f_{sr}$ , another BOX unit whose output torque is =  $M_{c2}$  (required torque) can also be chosen.  $M_{c2} = M_{r2} f_{sr}$

Note: This rule is valid only if the new BOX unit that has been selected in this way has a service factor  $f_s = 1$  in the performance tables.

Essentially, the value of  $f_s$  in the

performance tables refers to a case in which the effective torque requested by the application  $M_{r2}$  matches perfectly with the  $M_{n2}$  listed in this catalogue.

Whenever the torque indicated in the performance table is higher than the requested one. The offered service factor of the performance table can be increased according to the formula:

$$f_s \text{ on the table } \frac{M_{n2} \text{ on the Table}}{M_{r2}}$$

The value of  $f_s$  calculated in this way must be =  $f_{sr}$ .

A detailed technical line drawing of a complex mechanical assembly, possibly a turbine or engine component, is shown in the background. The drawing features various circular, cylindrical, and angular parts with intricate details and shading. A prominent circular feature with a central slot is visible on the left side. The drawing is rendered in a light gray color, serving as a background for the page.
